Description

From our annual harvest, we produce our Premium BBQ Briquettes with methods friendly to the environment.

Characteristics:

- Does not smell.
- Produces no ash or smoke during the burn cycle.
- Does not fly sparks.
- Easy to light up.
- Free of chemical additives.
- Efficient (fewer briquettes used per cook).
- Long lasting extreme high heat (maximum calorific value 6366 kcal / kg).
- Cooks your food to perfection, while enjoying the sweet smell of olives.

Ease of use:

To light the core, insert some briquettes into a special charcoal chimney or use an electric charcoal. Then, carefully place briquettes at the bottom of the surface and insert more if necessary. Once the briquets get a light gray color you are ready to bake.

Why choose OleaBriq briquettes instead of charcoal:

1. You do not have to wait for the flame to bake, the kernel does not make a flame, just when the briquets blush and emit heat you start!
2. You do not have to break the big pieces of woodcarp when the fire drops and spread them on the baking surface, the kernel has a uniform shape and you simply spread it.
3. You do not have to carve the charcoal when baking to light and move it, with the core charcoal just move some briquettes to the points you want to shift the intensity of the fire.
4. Nuclear charcoal releases 30% less carbon monoxide than the known charcoal
